The ATS M air turbine starters are designed to start the two EJ200 jet engines (cooperation between MTU, Rolls-Royce, Avio and ITP) that power the Typhoon Eurofighter.

The Typhoon Eurofighter program consists of over 600 aircraft for the Air Forces of the four founding nations of the programme (United Kingdom, Italy, Germany and Spain) and other non-European countries.

With its simple and robust design, the ATS M ensures that its users have all of the energy required for reliable and self-sufficient starting of the main engines.
Microturbo (Safran) specializes in the design and production of high-technology power systems and propulsion systems. State-of-the-art and reliable power solutions offered include the large proven range in Microturbo gas turbines, but also innovations resulting of an important R&D investment and strategic partnerships. Microturbo is a world leader in the field of power systems and propulsion systems and has delivered over 13,000 units.
